

FORMULAS AND NAMES OF SOME COMMON POLYATOMIC IONS AND THE ACIDS THEY COME FROM				
ACIDS		KEY ELEMENT	FORMULA	NAME OF ION
Nitric Acid	HNO <sub>3</sub>	Nitrogen	NO <sub>3</sub> <sup>-</sup>	nitrate
Nitrous Acid	HNO <sub>2</sub>		NO <sub>2</sub> <sup>-</sup>	nitrite
			NH <sub>4</sub> <sup>+</sup>	ammonium
Sulfuric Acid	H <sub>2</sub> SO <sub>4</sub>	Sulfur	SO <sub>4</sub> <sup>2-</sup>	sulfate
			HSO <sub>4</sub> <sup>-</sup>	bisulfate or hydrogen sulfate
Sulfurous Acid	H <sub>2</sub> SO <sub>3</sub>		SO <sub>3</sub> <sup>2-</sup>	sulfite
			HSO <sub>3</sub> <sup>-</sup>	bisulfite or hydrogen sulfite
Phosphoric Acid	H <sub>3</sub> PO <sub>4</sub>	Phosphorus	PO <sub>4</sub> <sup>3-</sup>	phosphate
			HPO <sub>4</sub> <sup>2-</sup>	hydrogen phosphate
			H <sub>2</sub> PO <sub>4</sub> <sup>-</sup>	dihydrogen phosphate
Phosphorus Acid	H <sub>3</sub> PO <sub>3</sub>		PO <sub>3</sub> <sup>3-</sup>	phosphite
Carbonic Acid	H <sub>2</sub> CO <sub>3</sub>	Carbon	CO <sub>3</sub> <sup>2-</sup>	carbonate
			HCO <sub>3</sub> <sup>-</sup>	bicarbonate or hydrogen carbonate
			C <sub>2</sub> O <sub>4</sub> <sup>2-</sup>	oxalate
Acetic Acid	HC <sub>2</sub> H <sub>3</sub> O <sub>2</sub>		C <sub>2</sub> H <sub>3</sub> O <sub>2</sub> <sup>-</sup>	acetate
			CN <sup>-</sup>	cyanide
		Chlorine	ClO <sub>4</sub> <sup>-</sup>	perchlorate
Chloric Acid	HClO <sub>3</sub>		ClO <sub>3</sub> <sup>-</sup>	chlorate
Chlorous Acid	HClO <sub>2</sub>		ClO <sub>2</sub> <sup>-</sup>	chlorite
			ClO <sup>-</sup>	hypochlorite
Boric Acid	H <sub>3</sub> BO <sub>3</sub>	Boron	BO <sub>3</sub> <sup>3-</sup>	borate
		Hydrogen	H <sub>3</sub> O <sup>+</sup>	hydronium
			OH <sup>-</sup>	hydroxide
		Metals	MnO <sub>4</sub> <sup>-</sup>	permanganate
			CrO <sub>4</sub> <sup>2-</sup>	chromate
			Cr <sub>2</sub> O <sub>7</sub> <sup>2-</sup>	dichromate

Note the following concerning polyatomic ions:

- Most of the ions have a negative charge, which can vary from 1<sup>-</sup> to 3<sup>-</sup>. Only two positive ions are listed in the table: NH<sub>4</sub><sup>+</sup> (ammonium) and H<sub>3</sub>O<sup>+</sup> (hydronium).
- Two of the polyatomic ions, OH<sup>-</sup> (hydroxide) and CN<sup>-</sup> (cyanide), have names ending in *-ide*. These names represent exceptions to the rule that the suffix *-ide* be reserved for use in naming binary ionic compounds.
- A number of *-ate*, *-ite*, pairs of ions exist, for example, SO<sub>4</sub><sup>2-</sup> (sulfate) and SO<sub>3</sub><sup>2-</sup> (sulfite). The ion in the pair with the higher number of oxygens is always the *-ate* ion. The *-ite* ion always contains one less oxygen than the *-ate* ion.
- A number of pairs of ions exist where one member of the pair differs from the other by having a hydrogen atom present, for example CO<sub>3</sub><sup>2-</sup> (carbonate) and HCO<sub>3</sub><sup>-</sup> (bicarbonate or hydrogen carbonate). In such pairs, the charge on the hydrogen containing ion is always one less than that on the other ion.
